

Week 5 - Sequences, Sets, Dictionary

One record is never enough. Let's make it accept multiple records.

```
$ python3 pymoney.py
```

```
How much money do you have? 1000
```

```
Add some expense or income records with description and amount:
```

```
desc1 amt1, desc2 amt2, desc3 amt3, ...
```

```
breakfast -50, lunch -70, dinner -100, salary 3500
```

```
Here's your expense and income records:
```

```
breakfast -50
```

```
lunch -70
```

```
dinner -100
```

```
salary 3500
```

```
Now you have 4280 dollars.
```

Required Steps

1. Modify the prompt strings.
2. Split the input string by commas then spaces and build a data structure like `[('breakfast', -50), ('lunch', -70), ...]`.
3. List the records and report the balance to the user.
4. Add some comments for your code.
